Alo in Australia: Reflection and Alternative Approach

Student name and number: [ ]

Word count: Question One 703; Question Two 1,037 (including headings and table; excluding figure, prompt and references). Total 1,740

Question One: Evaluating “Mat to Moment”

Week 10 defines campaign effectiveness as achieving intended outcomes rather than generating reach, likes or clicks (Bryant, 2026b). On that test, I think our campaign is likely to meet its store-awareness objective (O3) but is weakest on the price objective (O1), which our own report ranked first.

Strengths

Our objectives are a clear strength. Each is tied to a diagnosed challenge, set against a published benchmark (Meta, 2020) and paired with a measure, mirroring Week 10’s pairing of awareness with recall, perceptions with brand associations and action with conversions (Bryant, 2026b). Integration is also strong. Table 3 of our report holds the line, set and sign-off constant across ten touchpoints, and IMC builds trust and recall through repetition and consistency (Bryant, 2026f; Keller, 2001). Because store location is a simple fact that can be learned through the peripheral route (Bryant, 2026j; Petty et al., 1983), repeating it around the three stores makes the 10-point O3 lift plausible. Week 12 warns that efficiency for the company does not guarantee relevance for the consumer (Bryant, 2026k), so our localisation kept Alo’s global identity but gave the voice to Sydney instructors. Finally, the pre/post survey with a Melbourne control group addresses Week 10’s central post-testing question: how confidently can a change be attributed to the campaign (Bryant, 2026b; Gordon et al., 2019)?

Weaknesses

Audience. Segment A suits Alo because its members buy activewear as an expression of identity (Belk, 1988; Escalas & Bettman, 2005). However, it is also the segment most stretched by money: more than half of Gen Z and Millennials have delayed major life decisions because of financial

pressure (Bryant, 2026a; Deloitte, 2026). At A$100–200 per item, Alo is closer to “masstige” than to true luxury, and new-luxury buyers trade up in a few emotionally important categories while trading down elsewhere (Silverstein & Fiske, 2003). We followed Kapferer and Bastien’s (2009) luxury rule of meaning over justification. Yet Week 13 notes that value now means longevity and emotional reward as well as price (Bryant, 2026d), and guilt makes indulgent purchases less likely unless the context lets people justify them (Okada, 2005). The audience was right, but our message never confronted its defining tension.

Message. “Mat to Moment” is clear and single-minded, but creativity must be novel as well as relevant (Bryant, 2026h; Smith & Yang, 2004), and our line describes the category rather than the brand: athleisure is defined as clothing designed for both exercise and general use (Merriam-Webster, n.d.). Lululemon could run the same line, so pre-testing should check brand attribution (Bryant, 2026b). The central-route proof for price also sits mainly in Sanctuary Sessions, which our report admits reach “hundreds rather than thousands”. That is 22% of the budget spent on a mechanism that cannot shift a population-level survey measure. Most of Segment A would meet it only as filmed content while scrolling, where peripherally formed attitudes are weaker (Petty & Cacioppo, 1986).

Channels. We spread A$250,000 across ten touchpoint types, with only 40% in paid media. Week 10’s Ben & Jerry’s case shows the alternative: concentrating its spend on a single platform, it reached more than 3 million Australians and lifted ad awareness by 13 points and action intent among 21–24-year-olds by 7 points (Bryant, 2026b). Persuasion needs higher frequency than awareness (Bryant, 2026i), and spreading a small budget risks leaving each channel short of it. About 45% of spend also went to creators, sessions and PR, which carry less control and greater reputation risk (Bryant, 2026e), and the launch relies on a single lead creator.

Measurement. With about 400 respondents per wave, our survey reliably detects changes of roughly five points, yet O1 and O2 target six, so a smaller real shift could be missed. A platform brand-lift study with a randomised holdout, as in the Ben & Jerry’s case, would give stronger causal evidence than observational comparison (Bryant, 2026b; Gordon et al., 2019).

Improvements

Three changes would raise the campaign's likely effectiveness. First, deliver the price argument openly and at scale rather than relying on events. Second, concentrate paid media on Instagram and TikTok and measure it with randomised brand lift. Third, pre-test the proposition for brand attribution before launch. Question Two develops them.

Question Two: An Alternative Approach, “The Keep List”

Audience and Insight

I would retain Segment A, because its fit with Alo still holds (Belk, 1988; Inside Retail, 2026). What changes is how the campaign treats their money. Under financial pressure, consumers trade down or delay discretionary purchases (Bryant, 2026d), but this audience does not cut back quietly. In 2024, “loud budgeting”, openly saying what you will not spend on, spread on TikTok as a statement of choice rather than lack (Axios, 2024). The insight: Segment A is cutting back out loud, and what they keep says who they are. The campaign’s job is to make Alo one of the things they keep.

Table 1

Comparison of the Group Strategy and the Alternative

Element	**Mat to Moment (group)**	**The Keep List (alternative)**
Price	Proved only in sessions	Admitted openly everywhere
Proposition	Studio to street (category benefit)	Worth keeping (a justification)
Source	Instructors and creators	Peers sharing their own lists
Channels	Ten touchpoint types	TikTok and Instagram, plus store-area digital outdoor
Measurement	Survey with Melbourne control	Randomised brand lift plus survey

Why It Should Be More Effective

Message. The original campaign was one-sided. The Keep List is two-sided: it admits that Alo costs more, then explains why the trade is worth making. Two-sided messages increase perceived source credibility (Eisend, 2006), consumers increasingly expect brands to be transparent (Bryant, 2026f), and refuting an objection in advance protects beliefs against later counter-arguments (McGuire, 1961) such as “Lululemon is cheaper”. It also supplies the justification identified in Question One as missing (Okada, 2005). Mental accounting explains how: consumers assign spending to separate mental budgets (Thaler, 1999), and setting Alo beside cancelled takeaway moves it from a “fashion splurge” account into “things I use every day”. It remains a rational value appeal without discounting, which can weaken brand equity (Bryant, 2026d, 2026h).

Persuasion route. Under the Elaboration Likelihood Model, central processing requires both motivation and ability (Bryant, 2026j; Petty et al., 1983). A five-line list is read in seconds while scrolling yet carries an argument, bringing central-route persuasion to paid-social scale rather than to sessions reaching hundreds. This targets O1 directly.

Source and distinctiveness. Lists come from Sydney micro- and nano-creators and, later, customers. Micro-influencers achieve higher engagement and nano-influencers are highly trusted locally (Bryant, 2026e), and relatability is part of source attractiveness (Bryant, 2026j). Week 3's Frank Green case shows the model working: customer unboxing videos earned more than 17 million TikTok views (Bryant, 2026j). "Keep List" is also an ownable mechanic rather than a category benefit, so it should be easier to link to Alo (Sharp, 2010).

Channels and integration. About 70% of working media moves to TikTok and Instagram, which Segment A uses daily. TikTok offers longer time spent and lower ad costs than other platforms (Bryant, 2026c), and concentrating spend follows Week 10's Ben & Jerry's case (Bryant, 2026b). Creator posts are boosted as paid ads, so paid, owned and earned media carry the same content (Bryant, 2026c). A Stitch template invites users to post their own #KeepList, creating earned discovery content. Digital outdoor near the three stores shows consented customer lists, and staff hand buyers a "keep card" with care instructions. One mechanic therefore runs through every touchpoint. Sanctuary Sessions and Spotify are dropped to fund reach, and the fabric trial moves to in-store try-ons.

Measurement. An A/B pre-test (Bryant, 2026b) compares the two-sided list with a one-sided version on brand attribution and agreement that "Alo is worth paying more for". In flight, a platform brand-lift study with a holdout measures O1 and O3 causally, and social listening tracks whether comments read the campaign as honest or as rationalising overspending.

Creative Mock-up

Figure 1

"The Keep List" TikTok In-Feed Creator Post (Burst 1)

Note. AI-assisted mock-up; the photograph is a placeholder and the creator handle and engagement figures are illustrative. AI prompt used (Claude, Anthropic): "Create a 9:16 TikTok in-feed post mock-up (1080 × 1920 px) for Alo Yoga's Sydney 'Keep List' campaign. Audience: style-conscious women aged 22–34 in Sydney who do Pilates and are budgeting carefully. Background: a handheld, phone-shot scene of a woman in her mid-20s in a Bondi café after a reformer class, wearing a matching neutral Alo set, natural morning light, unretouched (use a labelled placeholder for the photograph). Overlay a phone Notes-app list titled 'my 2027 keep list' with CUT (uber eats on weeknights; 3rd streaming subscription; fast-fashion hauls, each struck through) and KEEP (tuesday reformer class; my alo set (worn 4x a week)), plus a handwritten aside: 'yes, it cost more than my old leggings. I wear it more than anything I own.' Show 'Paid partnership · Alo' and #ad at the top, a caption with #KeepList and an invitation to Stitch, a call-to-action card 'Make your keep list / Try the set: Chatswood · CBD · Bondi Junction' with a 'Find your store' button, and the sign-off 'ALO Worth

keeping.' Use a calm, minimal palette of cream, stone and black; keep platform interface elements generic, with no other brands' logos."

Figure 1 is a TikTok in-feed creator post for the first burst, built from Week 5's social-media tactics: a scroll-stopping hook, platform caption, hashtags, clickable call to action and user participation (Bryant, 2026h).

Message. The on-screen list is the argument: three things cut, two kept. The handwritten admission ("yes, it cost more than my old leggings") makes it two-sided, and the sign-off "Alo. Worth keeping." attaches the justification to the brand.

Imagery. The creator sits in a Bondi café after class, filmed handheld in natural light without retouching. This phone-shot style suits the platform and Gen Z's preference for authenticity (Francis & Hoefel, 2018).

Design. The list imitates a phone Notes app, a format read as personal rather than polished. Alo's neutral palette, wordmark and sticker maintain brand linkage. The "Paid partnership" label and #ad sit at the top, not behind "more", as Week 11 requires (Bryant, 2026g), because native formats can obscure that content is advertising (Wojdynski & Evans, 2016) and 96% of fashion influencers reviewed had posts raising consumer-law concerns (Australian Competition and Consumer Commission [ACCC], 2023).

Call to action. "Find your store" names Chatswood, the CBD and Bondi Junction to drive visits (O4), while "Make your keep list" invites Stitches that extend earned reach.

AI limitations. I used AI to build the mock-up. Its layout looks more templated than real phone content, and Week 13 warns that automated content can make brands look alike and that AI-generated people complicate authenticity (Bryant, 2026d), the quality this concept depends on. Its person and list are invented; in execution, every list must reflect the creator's real trade-offs, because an influencer cannot claim experiences they have not had (Bryant, 2026g). AI also renders a generic café, not a recognisably Sydney one, weakening local relevance.

Advantages, Limitations and Expected Effectiveness

Compared with the original, The Keep List puts the price argument in front of the whole segment, costs less per person persuaded and can be measured causally. It has three limitations. First, Week 11 lists financial stress as a source of vulnerability and separates persuasion from manipulation that

exploits it (Bryant, 2026g), so lists celebrate what people cut and never present the set as a necessity. Second, loud budgeting peaked in 2024 and may feel dated by 2027, so the campaign uses “Keep List” rather than the trend’s name. Third, talking about money risks diluting Alo’s prestige (Kapferer & Bastien, 2009), so Alo never discusses price in its own voice; peers do. On balance, I expect a stronger O1 result than the original, a similar O3 result and an O4 result that still depends on the store experience.
